# Behzad Ghabaei
# CS 82A - Dta Science
# Module 2 lab 1
# Python Warm - Up
# Instructor Seno
# 9/8/2026
```

Step 1: Wages with f-strings

In [2]:
```
name = "Maria-Anna Chen"
hourly_wage = 16.00
hours = 40
weekly_pay = hourly_wage * hours
print(f"Maria-Anna earns {weekly_pay} per week") #640.0
```

```
Maria-Anna earns 640.0 per week
```

Step 2: Count the warm days

In [3]:
```
temps = [61,65,72,58,70,74,68]
high = 0
for s in temps:
    if s > 65:
        high = high + 1
print(high) #4
```

```
4
```

Step 3: Write a temperature converter

In [4]:
```
def to_celcius(f):
    return (f - 32) * 5/9

print(round(to_celcius(temps[0]), 1) ) #16.1
```

```
16.1
```

Step 4: A movie dictionary

In [5]:
```
# {"key": "value"}
book = {"title": "Dune", "year": 1965, "rating": 100}
```

```
for key, value in book.items():
    print(key, ":", value)
```

```
title : Dune
year : 1965
rating : 100
```

Step 5: Load and inspect chickwts.csv

In [6]:
```
import pandas as pd
df = pd.read_csv("chickwts.csv")
df.head()
#df.tail()
```

Out[6]:

	Unnamed: 0	weight	feed
0	1	179	horsebean
1	2	160	horsebean
2	3	136	horsebean
3	4	227	horsebean
4	5	217	horsebean

In [7]:
```
df.shape
```

Out[7]: (71, 3)

In [8]:
```
df.describe()
```

Out[8]:

	Unnamed: 0	weight
count	71.000000	71.000000
mean	36.000000	261.309859
std	20.639767	78.073700
min	1.000000	108.000000
25%	18.500000	204.500000
50%	36.000000	258.000000
75%	53.500000	323.500000
max	71.000000	423.000000

Step 6: Interpret describe()

The **describe()** output tells us alot about the chick weight csv file. This is from the **Pandas** library. The **count** tell us how many chickens are participating in the survey. The **mean** tells us the average weight in grams of all the 71 chickens combined. The **std** is the standard deviation of all the chickens which describes the spread in between weights. A high std says the data is spread out. The **min** is the lowest value in the data set in chicken weight (grams). The **max** is the highest weight in the dataset. **StackOverflow.com** explains, imagine sorting your data from lowest to highest. **25%** means 25% of your data have the value 204.5 or below (less than or equal to). **50%** means, 50% of your data have the value 258.0 or below, and 75% means, **75%** of you data have a value of 323.5 or below. (My Prompt: "What does 25%, 50%, 75% mean in the describe() function?" | "What are 25%,50%,75% values when we describe a grouped dataframe?" | Sibbir Ahmed | https://stackoverflow.com/questions/57869926/what-are-25-50-75-values-when-we-describe-a-grouped-dataframe)
